Report Overview

Plastic-lined steel pipes are composite pipes consisting of an outer steel shell for structural strength and an inner plastic liner (commonly polyethylene, polypropylene, or PTFE) for corrosion resistance, chemical inertness, and smooth fluid flow. Designed for harsh environments, these pipes are widely used in industries such as oil and gas, chemical processing, water treatment, and mining, where both mechanical durability and resistance to corrosive or abrasive media are critical. The steel layer provides high pressure and impact resistance, while the plastic lining prevents chemical degradation, reduces friction, and minimizes scaling or fouling. This dual-layer construction makes them ideal for transporting aggressive fluids, slurries, or gases, offering a cost-effective alternative to solid corrosion-resistant alloys while maintaining longevity and performance. The market demand is driven by increasing industrialization, stringent environmental regulations, and the need for durable infrastructure in corrosive applications.
