Report Overview

A Sink Float Separation Tank is an industrial process equipment designed to separate solid particles based on their specific gravity. This tank utilizes the principle of buoyancy, where heavier particles (sink) settle at the bottom, while lighter particles (float) rise to the surface. The product is typically employed in mining, mineral processing, and wastewater treatment applications to separate valuable minerals from waste rock or to remove contaminants from water. The separation process is facilitated by the introduction of water or air, which creates a fluidized bed within the tank, allowing the particles to be sorted according to their density. The design of the tank may include features such as baffles, riffles, or cones to enhance the separation efficiency. The end result is a more efficient and cost-effective method of particle separation, leading to improved product quality and reduced waste.
