Report Overview

Plasticizers for polyurethane (PU) are chemical additives used to increase the flexibility, durability, and workability of PU materials by reducing intermolecular forces and lowering the glass transition temperature. These additives are crucial in applications where elasticity and softness are required, such as in flexible foams, coatings, adhesives, sealants, and elastomers. Common plasticizers for PU include phthalates, adipates, phosphates, and bio-based alternatives like epoxidized vegetable oils, each offering distinct performance characteristics such as thermal stability, compatibility, and low volatility. The selection of plasticizers depends on factors like regulatory compliance, environmental impact, and end-use requirements, with a growing shift toward non-phthalate and sustainable options due to tightening environmental regulations and increasing consumer demand for safer, eco-friendly products. The market is driven by expanding applications in automotive, construction, footwear, and furniture industries, where PU's versatility and performance advantages are highly valued.
