Report Overview

Plerixafor Injection is a pharmaceutical product designed for intravenous administration, primarily used in medical procedures involving stem cell mobilization and transplantation. It is a synthetic, non-peptide CXCR4 receptor antagonist, which works by blocking the CXCR4 receptor on the surface of white blood cells, thereby preventing them from binding to their natural ligand, CXCL12. This action facilitates the release of these cells from the bone marrow into the bloodstream, making them available for collection and subsequent transplantation. Plerixafor Injection is typically used in conjunction with granulocyte colony-stimulating factor (G-CSF) to enhance the mobilization of hematopoietic stem cells in patients undergoing autologous stem cell transplantation, particularly those with non-Hodgkin's lymphoma or multiple myeloma. The product is manufactured under strict quality control standards and is provided in a sterile, single-use vial for healthcare professionals to administer to patients as part of a comprehensive treatment plan.
