Report Overview

PMMA Modified Bone Powder is a specialized orthopedic material designed for use in bone repair and reconstruction procedures. It is a composite material that combines the properties of polymethyl methacrylate (PMMA), a thermoplastic polymer known for its strength and stability, with bone powder. The bone powder, typically derived from natural bone sources, provides a biocompatible scaffold that promotes bone growth and integration. The PMMA component enhances the mechanical strength and durability of the material, making it suitable for applications such as filling bone defects, augmenting bone grafts, or as a component in cemented joint replacements. The modification of bone powder with PMMA aims to create a material that offers the best of both worlds: the osteoconductive properties of bone and the structural integrity of PMMA, resulting in a product that is both strong and conducive to bone healing.
