Report Overview

Pneumatic artificial muscles (PAMs) are flexible, contractile actuators that mimic the behavior of biological muscles by expanding radially and contracting axially when pressurized with air or gas. These devices, also known as McKibben muscles, consist of an inflatable inner bladder surrounded by a braided mesh sleeve, which converts pneumatic energy into mechanical motion. PAMs are lightweight, highly compliant, and capable of generating significant force relative to their size, making them ideal for applications requiring soft, adaptable actuation, such as robotics, prosthetics, rehabilitation devices, and industrial automation. Their simplicity, high power-to-weight ratio, and inherent safety due to lack of rigid components distinguish them from traditional electromechanical actuators. However, challenges such as nonlinear force-displacement characteristics, hysteresis, and the need for precise pressure control can impact their performance and adoption in precision-critical applications. The market for PAMs is driven by advancements in soft robotics, increasing demand for human-safe automation, and growing applications in medical and assistive technologies.
