Report Overview

Point-to-Point Protocol (PPP) is a data link layer communication protocol used to establish a direct connection between two nodes in a network, primarily for point-to-point serial connections. It supports authentication, encryption, and compression, making it widely used in dial-up internet access, leased lines, and broadband connections. PPP operates by encapsulating network layer protocols, such as IP, within its frames, ensuring seamless data transmission. It also includes features like Link Control Protocol (LCP) for link setup and Network Control Protocol (NCP) for configuring different network layer protocols, enhancing its flexibility and reliability. While newer technologies like Ethernet and wireless protocols have reduced its prevalence, PPP remains relevant in legacy systems, VPNs, and certain telecommunications applications where direct serial communication is required.
