Abstracts

Stress bars are typically used in PMFs to induce controlled stress within the fiber and optimize the fiber's polarization-maintaining characteristics. The application of stress can create birefringence in the fiber, which helps maintain the polarization state of light. Different methods can be used to impose stress on the fiber, such as boron doping, side grooves, or applying external mechanical stress.

The global Polarization Preserving Fiber Boron Doped Stress Bar market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
