Report Overview

Poly-L-lysine and its derivatives are a group of biopolymers derived from the amino acid L-lysine. These compounds are characterized by their high positive charge density due to the presence of multiple lysine residues, which contain a primary amine group. Poly-L-lysine is synthesized through a polymerization process, and its derivatives can be obtained by chemical modification of the parent compound. These biopolymers have a wide range of applications in various fields, including biochemistry, cell biology, and material science. They are commonly used for cell culture, tissue engineering, and as a coating material to promote cell adhesion. Additionally, poly-L-lysine and its derivatives can be employed in drug delivery systems, gene transfection, and as a component in certain types of adhesives and coatings. The versatility of these compounds stems from their ability to interact with negatively charged surfaces and their biocompatibility, making them valuable tools in both research and industrial applications.
