### Report Overview

Poly(Caprolactone) diol (PCL diol) is a biodegradable polyester polyol derived from the ring-opening polymerization of  $\epsilon$ -caprolactone, characterized by its low viscosity, excellent hydrolytic stability, and flexibility even at low temperatures. It serves as a key intermediate in the production of polyurethanes, adhesives, coatings, and elastomers, where its superior mechanical properties, biocompatibility, and resistance to oils and chemicals make it highly desirable in industries such as automotive, medical devices, and textiles. The market for PCL diol is driven by increasing demand for sustainable and high-performance materials, particularly in eco-friendly applications like biodegradable packaging and biomedical implants, though cost and competition from alternative polyols like polyether and polyester diols may pose challenges. Growth is further supported by advancements in polymer technology and regulatory push toward greener materials, with Asia-Pacific leading production and consumption due to expanding industrial and healthcare sectors.
