Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Polycrystalline Composite Sheet competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Global sales of polycrystalline composite sheets (PCS) reached 26 million units in 2024, with an average selling price of US\$40.42 per sheet. PCS, commonly referred to as "polycrystalline diamond compact" (PDC), is an ultra-hard composite material made by sintering synthetic diamond powder with a cemented carbide matrix under high temperature and high pressure. It combines the extreme hardness and wear resistance of diamond with the toughness and weldability of cemented carbide, making it one of the most representative superhard materials in the industrial field. The upstream raw material structure of PDC is clear and can be broken down into four major components: diamond powder, metal binder, cemented carbide matrix, and high-pressure synthesis equipment. China holds a 90% global production capacity for diamond powder (which accounts for 28-32% of PDC costs). Its primary suppliers are Zhongnan Diamond, Yellow River Cyclone, and Power Diamond, all located in Henan. Drilling-grade materials require a TI \geq 60 and a TTI \geq 55. Only Zhongnan Diamond and Huanghe Cyclone can consistently meet these standards in large quantities. Nano-level metal impurities must be
