## Abstracts

A Polymer Discontinuous Screen Changer is a device used in the polymer processing industry to filter and remove contaminants from molten polymer materials during extrusion. This screen changer operates in a batch or discontinuous manner, meaning that it changes the filtration screen while the extrusion process is temporarily halted. The device typically consists of a chamber that houses a filter screen or mesh, which captures impurities such as gels, debris, or other particulate matter that could affect the quality of the final product. When the screen becomes clogged or needs replacement, the polymer flow is diverted, and the contaminated screen is removed and replaced with a new, clean one. This process ensures that the polymer being processed remains free of contaminants, improving the quality and consistency of the finished product. While discontinuous screen changers may require interruptions in the extrusion process, they are valued for their effectiveness in maintaining high product standards and protecting downstream equipment from damage caused by impurities.

The global Polymer Discontinuous Screen Changer market size was estimated at USD 285.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
