Abstracts

Nucleating agent is a polymer modification additive mainly used to improve the properties of polyolefins, especially polypropylene. They improve the physical and mechanical properties of materials, such as transparency, surface gloss, tensile strength, rigidity, heat distortion temperature and impact resistance, by accelerating the crystallization rate, increasing crystal density and refining the grain size. Nucleating agents are divided into organic and inorganic types according to their chemical structure. Organic nucleating agents include carboxylic acid metal salts, phosphate metal salts and sorbitol benzylidene derivatives, while inorganic nucleating agents mainly include talc, calcium oxide, carbon black, etc. These nucleating agents not only improve the performance of the polymer, but also help shorten the molding cycle, thereby improving production efficiency.

The global Polyolefin Toughening Nucleating Agent market size was estimated at USD 285.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
