Abstracts

Polyols are reactive stocks that contain at least 2 functional groups and through these groups, they react with isocyanate (NCO) groups to form their polyurethane structure. Polyols can be classified as several different groups in their areas of usage. Polyols are separated into two groups such as hydroxyl and amino-terminated groups. The features of polyurethane products are mostly affected by polyols in their substance. Most of the chemical, physical and mechanical features of polyurethane products are directly connected with the chemical structures of polyols that are used in their structures. The characterization of the polyols that are used for preparation of polyurethanes is performed in several ways. The characterization of the polyols is performed based on their numbers, functionality, molecular weight and range, equivalence weight, water content, reactivity, viscosity, intensity, colour and acid value. Considering their amount used in polyurethane systems the most common ones are polyether polyols and polyester polyols. Apart from these, amino-terminated polyether polyols and a little amount of polycarbonate polyols are also utilized. All of these chemical structures of polyol structures are stated below.

The global Polyols For Polyurethane Foams Plastics market size was estimated at USD 15230.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
