Report Overview

A polysilicon etching machine is a device used to etch polysilicon films in semiconductor manufacturing. Polycrystalline silicon is a silicon material composed of multiple crystal grains. It has high electrical conductivity and photoelectricity and is widely used in solar cells, transistors, memories and other fields. Polycrystalline silicon etching machines mainly use dry etching technology, using plasma to react physically or chemically with the polycrystalline silicon surface to form volatile substances or directly bombard the film surface, thereby achieving pattern transfer and morphology control of polycrystalline silicon. The main types of polysilicon etching machines are capacitively coupled etching machines (CCP) and inductively coupled etching machines (ICP). CCP has higher energy but poor adjustability and is suitable for etching harder polysilicon; ICP has low energy but can It has strong controllability and is suitable for etching polysilicon with low hardness or thin thickness.
