## Abstracts

Orthopedic implants require materials with high mechanical strength and good integration with bone tissue. Polyurethane is widely used in bone cement, joint replacement materials and bone plates due to its adjustable hardness and elasticity. This material not only provides sufficient support, but also promotes the growth of bone tissue through chemical modification, allowing the implant to better integrate with the surrounding bone tissue. The lightweight properties of polyurethane also reduce patient burden, especially in major joint replacement surgeries, where the use of polyurethane implants has significant advantages. In the field of artificial organs, the biocompatibility and durability of materials are crucial. Due to its excellent biocompatibility and mechanical properties, polyurethane has become an important component of artificial organs such as artificial hearts and artificial blood vessels. Polyurethane materials can be used in the body for a long time and are not likely to cause rejection reactions. At the same time, through chemical modification, polyurethane materials can be designed to have specific hardness and flexibility to adapt to the needs of different organs, thereby ensuring that artificial organs can still maintain their functional stability under high loads.

The global Polyurethane Implantable Devices market size was estimated at USD 66.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.40% during the forecast period.
