Abstracts

Portable Exchange Deionization (PEDI) Service is a water treatment process used to remove dissolved ions from water. It involves the exchange of ions present in the water with ions in a resin bed, effectively removing impurities such as calcium, magnesium, sodium, and other positively charged ions, as well as anions like chloride, sulfate, and nitrate. The 'portable exchange' aspect refers to the fact that the deionization system can be transported to the site where water treatment is needed. This is particularly useful for temporary or mobile operations where a permanent water treatment system might not be practical or cost-effective. PEDI services are commonly used in various industries where high-quality water is required for processes such as manufacturing, pharmaceutical production, laboratory work, and more. By outsourcing the deionization process to a service provider, companies can ensure consistent access to purified water without the need for investing in and maintaining their own equipment.

The global Portable Exchange Deionization Service market size was estimated at USD 220.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
