Abstracts

A Portable Radiography Acquisition System is a medical imaging device that allows for the acquisition of X-ray images using a portable, handheld device. This system consists of a portable X-ray generator, a digital detector panel, and an image processing unit. The portable X-ray generator emits X-rays that penetrate the patient's body and are detected by the digital detector panel. The digital detector panel converts the X-rays into digital signals, which are then transmitted to the image processing unit. The image processing unit processes the digital signals and produces high-quality X-ray images that can be viewed on a computer or other display device. Portable radiography systems are typically used in emergency rooms, intensive care units, and other clinical settings where it may not be possible to move patients to a dedicated X-ray room. They are also commonly used in veterinary clinics and field hospitals where mobility and flexibility are important factors. Portable radiography acquisition systems offer several advantages over traditional X-ray systems, including improved portability, faster image acquisition times, and reduced radiation exposure for both patients and healthcare professionals.

The global Portable Radiography Acquisition System market size was estimated at USD 485.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
