Abstracts

A positive pressure intravenous indwelling needle is a medical device used for indwelling a human vein for clinical infusion, injection of medicine (blood) or blood extraction. It has the following characteristics: It can achieve needle-free connection with infusion and injection equipment, avoid the risk of needle puncture, and reduce infection and the generation of needle waste. It has a positive pressure function, that is, when the infusion device is disconnected from the indwelling needle, the liquid in the indwelling needle will automatically rush into the catheter, generating an instant positive pressure to prevent blood backflow and reduce the possibility of catheter blockage. It does not require the use of tape to fix scalp needles, which reduces the discomfort of patients with tape allergies and improves patient comfort and safety.

The global Positive Pressure Intravenous Catheter market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
