Abstracts

A post-operative immobilization knee brace is a medical device designed to provide support and restriction of movement to the knee joint following surgery. This specialized knee brace is commonly prescribed for individuals recovering from various knee surgeries, such as ligament repairs or reconstructions. The brace is designed to immobilize the knee in a specific position, minimizing stress on the surgical site and promoting proper healing. Typically, post-operative knee braces are adjustable to accommodate swelling and changes in the patient's condition during the recovery process. They often feature padding and straps for a secure and comfortable fit. The primary goal of a post-operative immobilization knee brace is to protect the knee joint, prevent unintended movements, and support the rehabilitation process by maintaining the desired alignment and stability during the critical post-surgery recovery period.
