Report Overview

The Posterior Occipitocervical Spine Screw System is a medical device designed for spinal stabilization and fusion procedures in the upper cervical spine region, specifically involving the occiput and cervical vertebrae. This system typically consists of a set of screws, rods, and connecting elements that are implanted into the posterior aspect of the spine to provide rigid fixation and support. The screws are inserted into the occiput (the back of the skull) and the cervical vertebrae, while the rods are used to connect these screws, creating a stable construct that can help correct spinal deformities, stabilize fractures, or promote fusion following spinal surgery. The system may also include various tools and instruments necessary for the implantation process, ensuring precise placement and secure fixation of the components.
