Report Overview

The poultry misting system is a specialized cooling and humidity control solution designed for poultry farms, primarily to regulate temperature and improve air quality in poultry houses during hot weather. These systems consist of high-pressure pumps, nozzles, and piping networks that disperse a fine mist of water, reducing ambient temperature through evaporative cooling while minimizing water wastage. They are critical in preventing heat stress among birds, which can negatively impact growth rates, egg production, and overall flock health. Modern misting systems often integrate with automated environmental controllers, allowing precise adjustments based on real-time temperature and humidity data. The technology is particularly relevant in regions with high temperatures, where traditional ventilation alone may not suffice. Additionally, some advanced systems incorporate disinfectant or sanitizer delivery, enhancing biosecurity by reducing airborne pathogens. The design and efficiency of these systems vary based on poultry house size, bird density, and climatic conditions, with larger commercial operations opting for fully automated, programmable setups.
