Report Overview

Powder fire extinguishing agents are dry chemical compounds designed to suppress fires by interrupting the chemical chain reaction of combustion. These agents, typically composed of monoammonium phosphate, sodium bicarbonate, or potassium bicarbonate, are effective against Class A (ordinary combustibles), Class B (flammable liquids), and Class C (electrical) fires. They work by forming a barrier that smothers flames and inhibits reignition. While widely used due to their versatility and cost-effectiveness, powder agents can leave residue and may not be suitable for sensitive environments like data centers or laboratories. The market for these extinguishing agents is driven by stringent fire safety regulations, industrial growth, and increasing awareness of fire hazards, though competition from clean-agent and foam-based alternatives presents challenges.
