Report Overview

Powder sunscreens are a unique type of sun protection product that come in a dry, powder form. Unlike traditional sunscreens that are applied as a liquid or cream, powder sunscreens are designed to be easily applied to the skin without the need for rubbing or spreading. They are typically composed of finely milled particles that contain active ingredients such as zinc oxide or titanium dioxide, which provide broad-spectrum protection against both UVA and UVB rays. These powders are often favored for their non-greasy, quick-absorbing, and matte finish, making them suitable for use on the face and body, especially in hot or humid conditions where traditional sunscreens might feel heavy or cause skin to feel oily. Powder sunscreens are also appreciated for their portability and ease of application, allowing for quick touch-ups throughout the day without the mess associated with liquid formulas.
