Report Overview

A Power Thermistor is an electronic component designed to regulate temperature by dissipating heat. It is a type of resistor whose resistance changes with temperature variations. Made from materials like ceramic or polymer, power thermistors are engineered to have a predictable and precise temperature-resistance relationship. They are commonly used in applications requiring precise temperature control, such as in heating systems, temperature sensors, and electronic devices. Power thermistors can be classified into two main types: Negative Temperature Coefficient (NTC) thermistors, which decrease in resistance as temperature increases, and Positive Temperature Coefficient (PTC) thermistors, which increase in resistance as temperature rises. These components are crucial in maintaining safe operating temperatures and preventing overheating in various electronic and mechanical systems.
