Report Overview

A precious metal carrier catalyst is a type of catalyst that uses precious metals, such as platinum, palladium, or rhodium, as the active component. These catalysts are used in various chemical reactions to increase the rate of reaction or improve selectivity. The precious metal is typically supported on a carrier material, such as alumina, silica, or carbon, which provides a high surface area for the metal to interact with the reactants. The carrier material also helps to stabilize the precious metal and prevent its aggregation or sintering during the reaction. Precious metal carrier catalysts are widely used in industries such as petroleum refining, chemical synthesis, and environmental protection. They are particularly effective in reactions that involve hydrogenation, oxidation, or dehydrogenation processes.
