Abstracts

Prelithiation technology for Si-based anode involves the preloading or prelithiating of silicon (Si) materials with lithium ions before assembling them into a lithium-ion battery. Silicon has a high theoretical capacity for lithium storage, but it undergoes significant volume expansion and contraction during charge and discharge cycles, leading to performance degradation. Prelithiation helps mitigate these issues by introducing lithium into the silicon structure in a controlled manner, reducing the initial capacity loss and improving the overall electrochemical performance of the battery. This technology aims to enhance the energy density, cycling stability, and efficiency of lithium-ion batteries with silicon-based anodes, making them more practical for various applications.

The global Prelithiation Tchnology For Si Based Anode market size was estimated at USD 187.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.75% during the forecast period.
