Report Overview

Programmable Integrated Circuits (ICs) are a type of semiconductor devices that can be customized and programmed by the user to perform specific functions. These ICs are designed to offer flexibility and adaptability in electronic systems, allowing engineers to modify the circuit's behavior without changing the underlying hardware. Programmable ICs encompass a range of products, including Field-Programmable Gate Arrays (FPGAs), Programmable Logic Devices (PLDs), and Complex Programmable Logic Devices (CPLDs). They are widely used in various applications such as telecommunications, automotive electronics, aerospace, and consumer electronics, where the ability to reconfigure the hardware in response to changing requirements is crucial. The programming of these ICs is typically done through software tools that enable the user to define the desired logic functions, which are then implemented in the hardware, providing a cost-effective and efficient solution for rapid prototyping and product development.
