Abstracts

Poly ADP-ribose polymerase (PARP) is a DNA repair enzyme involved in the single-strand repair process of DNA. PARP inhibitors (PARPi) inhibit PARP activity through two mechanisms: direct inhibition of PARP function and PARP trapping, resulting in the stalling and collapse of replication forks, resulting in fatal double-strand breaks. Normal cells can repair double-strand breaks in time and correctly through homologous recombination repair (HRR); however, in tumor cells carrying HRR gene mutations, due to the impairment or loss of HRR function, the accumulated double-strand breaks will not be repaired in time and correctly, resulting in The tumor cell genome is unstable and eventually induces tumor cell death.
