### Report Overview

"Protecting unnatural amino acids" is a chemical synthesis strategy used to synthesize amino acids with unnatural structures or properties that are not commonly found in nature. These unnatural amino acids are often used in biochemical research, protein engineering, drug development, and other fields to improve the properties of proteins or design new bioactive molecules. When synthesizing unnatural amino acids, it is often necessary to take measures to protect their specific functional groups or reaction sites to prevent them from unnecessary damage or interference during the synthesis process. This is called "protecting unnatural amino acids". A protecting group is a chemical functional group that can be attached to a specific site on an unnatural amino acid to protect its chemical properties. Once synthesis is complete, the protecting groups can be removed, restoring the original structure of the unnatural amino acid.
