Report Overview

A Protective Current Transformer (PCT) is a specialized type of current transformer (CT) used in electrical power systems for protection and monitoring purposes. Unlike standard CTs, which are designed to provide a scaled-down version of the primary current for metering and control applications, PCTs are specifically engineered to meet the stringent requirements of protective relaying. They are designed to have a high degree of accuracy, low burden, and a wide range of ratios to ensure reliable operation of protective devices under various fault conditions. PCTs typically feature a high degree of linearity and stability, allowing them to accurately represent the primary current even during transient events such as faults. They are crucial components in power system protection schemes, ensuring the safe and efficient operation of electrical grids by providing accurate current information to relays and other protective devices.
