Report Overview

Protein Tyrosine Kinase (PTK) refers to a class of enzymes that play a crucial role in cell signaling and regulation. These enzymes are characterized by their ability to transfer a phosphate group from ATP to specific tyrosine residues on target proteins, thereby modulating their activity. PTKs are involved in a wide range of cellular processes, including cell growth, differentiation, and migration. They can be categorized into two main types: receptor tyrosine kinases (RTKs), which are transmembrane proteins that respond to extracellular signals, and non-receptor tyrosine kinases, which operate within the cell and are involved in intracellular signaling pathways. The activity of PTKs is tightly regulated, and their dysregulation has been implicated in various diseases, including cancer. Understanding the structure, function, and regulation of PTKs is essential for developing targeted therapies for these conditions.
