### Report Overview

A Proximity Thermopile Sensor is a type of non-contact temperature measurement device that utilizes the thermoelectric effect to detect temperature differences. It consists of a series of thermocouples arranged in a specific pattern to form a thermopile. When there is a temperature gradient across the thermopile, it generates a voltage proportional to the temperature difference. This sensor is highly sensitive to changes in temperature and can accurately measure the temperature of objects without direct contact, making it ideal for applications where physical contact is not possible or desired. The Proximity Thermopile Sensor is commonly used in various industries, such as automotive, industrial automation, and medical equipment, for tasks like detecting temperature changes in engines, monitoring temperature in manufacturing processes, and measuring body temperature for medical diagnostics.
