Report Overview

A PTC thermistor for surge current suppression is an electronic component that utilizes the temperature-dependent resistance properties of a Positive Temperature Coefficient (PTC) material. This type of thermistor is specifically designed to protect electrical circuits from damage caused by excessive current surges. When a surge current occurs, the PTC thermistor heats up, causing its resistance to increase rapidly. This increase in resistance effectively limits the current flow, thereby protecting the circuit from potential damage. The PTC thermistor is self-resettable, meaning that once the surge current subsides and the temperature drops, the thermistor returns to its original low resistance state, allowing normal operation to resume. This product is commonly used in applications such as power supplies, battery protection, and motor control circuits to ensure reliable and safe operation.
