Abstracts

Polytetrafluoroethylene (PTFE) coated imaging guide wire is a commonly used medical device in cardiovascular intervention therapy. It is a guide wire composed of a metal core shaft and a PTFE (a material with good sliding and wear resistance) coating. The main function of this guide wire is to guide the catheter through the vascular system during cardiovascular intervention surgery and assist doctors in diagnosis and treatment operations. The PTFE coating enables the guide wire to have good bending and sliding properties, allowing it to easily pass through the curved parts of blood vessels while reducing friction with the inner wall of blood vessels and reducing the risk of vascular damage. In addition, PTFE coating can also reduce the possibility of thrombosis and improve the service life of the guide wire. In cardiovascular intervention surgery, doctors usually use PTFE coated contrast wires to guide contrast agents and other treatment equipment into the heart and vascular system for diagnosis, treatment, or surgical procedures. The use of this guide wire can help doctors more accurately locate the lesion site, reduce surgical risks, and improve the success rate of surgery.

The global Ptfе Coated Angiographic Guide Wire market size was estimated at USD 185.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
