Report Overview

A Pull Rod Type Displacement Sensor, also known as a Linear Variable Displacement Sensor, is a device used to measure the linear movement or displacement of an object. It operates on the principle of converting linear motion into an electrical signal. The sensor typically consists of a Pull Rod connected to a resistive or capacitive element. As rod moves, the resistance or capacitance changes, which is detected by the sensor and converted into an electrical signal proportional to the displacement. These sensors are widely used industrial applications, such as robotics, automation, and machinery, where precise measurement of linear movement is essential.
