Report Overview

A Pulsatile Blood Pump is a medical device designed to mimic the natural rhythmic flow of blood in the human circulatory system. It is typically used in situations where the heart is unable to pump blood effectively, such as in cases of severe heart failure or during certain surgical procedures. The device works by creating a pulsatile flow, which is a series of rhythmic contractions and relaxations that propel blood through the circulatory system. This is in contrast to continuous flow pumps, which provide a steady, non-pulsatile flow. Pulsatile Blood Pumps aim to replicate the body's natural cardiac cycle more closely, potentially offering benefits such as improved organ perfusion and reduced risk of complications associated with non-pulsatile flow. These pumps can be temporary or permanent solutions, depending on the patient's condition and treatment plan.
