Report Overview

A pulse modulated TOF (Time-of-Flight) camera is a camera that performs depth measurement based on the time-of-flight principle. It continuously emits light pulses (usually invisible light) to the target object and receives the light pulses reflected from the object. It calculates the distance between the measured object and the camera by detecting the flight (round-trip) time of the light pulses. In a pulse modulated TOF camera, pulse modulation is a key modulation method that directly measures the distance based on the time difference between pulse emission and reception.
