Report Overview

A Pulsed Neutron Logging Tool is a specialized equipment used in the oil and gas industry for subsurface analysis. It operates by emitting a pulsed neutron source into the formation, which then interacts with the atomic nuclei of the surrounding materials. This interaction results in the emission of secondary neutrons and gamma rays, which are detected by the tool's sensors. The data collected from these emissions is then analyzed to determine the elemental composition, porosity, and other properties of the formation. This information is crucial for optimizing well placement, assessing reservoir characteristics, and monitoring production over time. The tool is designed to provide accurate and reliable data, enabling better decision-making in drilling and production activities.
