Report Overview

A Pulverized Coal-fired Boiler is a type of boiler that utilizes pulverized coal as its primary fuel source. This system involves grinding coal into a fine powder, which is then blown into the boiler's combustion chamber where it is ignited and burned to produce heat. The heat generated is used to produce steam, which drives a turbine to generate electricity or provides heat for industrial processes. The pulverized coal technology allows for more efficient combustion and better control of emissions compared to other coal-fired boiler systems. This type of boiler is commonly used in power plants and industrial facilities due to its ability to handle large amounts of coal and produce significant amounts of steam.
