Report Overview

Pumped Storage Hydropower (PSH) is a type of hydroelectric energy storage system that utilizes the principles of water elevation and gravitational potential energy. In this system, excess energy from the power grid is used to pump water from a lower elevation reservoir to a higher elevation reservoir during periods of low energy demand. When energy demand increases or during peak hours, the stored water is released from the upper reservoir, flowing back down to the lower reservoir through turbines, which generate electricity. This process effectively stores energy as potential water power and converts it into electricity when needed. PSH plants are characterized by their ability to provide large-scale energy storage, grid stability, and frequency regulation, making them a valuable resource for integrating intermittent renewable energy sources like wind and solar power into the electricity grid.
