Report Overview

Pyrolysis gasoline (Pygas) is a byproduct generated during the steam cracking process, which is used to produce olefins such as ethylene and propylene. It is a complex mixture of hydrocarbons, primarily composed of aromatics, olefins, and paraffins. Pygas is typically characterized by its high octane rating, making it a valuable component in the production of gasoline blends. It contains a significant amount of benzene, toluene, and xylene (BTX), which are important petrochemical feedstocks. The composition of Pygas can vary depending on the feedstock and cracking conditions, but it generally has a research octane number (RON) of around 90-95, indicating its potential as a high-octane blending component. Pygas is also used as a feedstock for further processing, such as catalytic reforming or isomerization, to produce high-octane components for gasoline or other valuable petrochemicals. Due to its variable composition and the presence of reactive components, Pygas handling and processing require careful consideration of safety and environmental regulations.
