Report Overview

A radioactive iodine sampler is a device used to collect and measure radioactive iodine particles in the air. It is often used in nuclear power plants and other facilities handling radioactive substances to monitor the potential release of radioactive iodine into the environment. A sampler typically consists of a filter for collecting particulate matter in the air and a detector for measuring the amount of radioactive iodine collected on the filter. Filters are usually made of activated carbon or silver zeolite, both of which can effectively capture radioactive iodine particles. After placing the sampler for a period of time, usually from a few hours to a few days, remove the filter and use specialized equipment in the laboratory for analysis to determine the content of radioactive iodine. This information can be used to assess potential health risks for workers and the public, and to provide information for emergency response work when necessary.
