Abstracts

The radiofrequency ablation auxiliary system is a medical equipment system that integrates multiple components such as radiofrequency host, electrode needle device, electrode sheet module, perfusion pump, remote control, foot switch, cable, etc. The system uses the heat energy generated by high-frequency electric energy to destroy abnormal tissues in the body or reduce their functions. It is particularly suitable for cardiac radiofrequency ablation treatment, tumor treatment, cosmetic medicine, and neurological disease treatment. The working principle of the radiofrequency ablation auxiliary system is based on the thermal effect generated by high-frequency electric energy. The radiofrequency power supply generates high-frequency current, which is transmitted to the human body through the catheter. The electrode releases high-frequency electric energy, forms a radiofrequency electric field in the body, and exchanges heat with the surrounding tissues. High-temperature energy destroys the structure and function of target tissue cells through thermal effects to achieve the therapeutic effect.

The global Radiofrequency Ablation Assisted System market size was estimated at USD 120.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
