Report Overview

Radius Loop Electrodes are specialized medical devices primarily used in the field of electrophysiology, specifically for cardiac ablation procedures. These electrodes are designed with a looped shape, which allows for a larger surface area contact with the cardiac tissue, facilitating efficient delivery of radiofrequency energy to create lesions and treat arrhythmias. The "radius" in the name refers to the curvature of the loop, which can vary depending on the specific model and application. The electrodes are typically made from materials like platinum-iridium alloy, which is known for its durability and effective energy properties. They are connected to a generator that provides the necessary energy for ablation, and their design may include features such as temperature sensors or irrigation channels to enhance safety and efficacy during the procedure. Radius Loop Electrodes are an essential tool for electrophysiologists, enabling them to accurately target and treat various types of cardiac arrhythmias.
