Report Overview

A rail contact clamp, also known as a rail contactor or rail clamp, is a device used in railway systems to provide electrical contact between the train and the overhead catenary or third rail. It is specifically used in electrified train systems where the trains rely on continuous electrical power supply to operate. The rail contact clamp consists of a clamping mechanism and electrical contacts. The clamping mechanism is designed to securely attach the clamp to the overhead catenary or third rail, ensuring a reliable electrical connection. The electrical contacts within the clamp establish a connection with the power source, allowing the train to receive the necessary electrical energy for propulsion, lighting, and onboard systems.
