Abstracts

A Rapamycin-Eluting Coronary Stent System is a medical device used to treat narrowed or blocked coronary arteries. The system consists of a stent coated with the drug sirolimus. The stent is implanted into the coronary artery, providing mechanical support to keep the vessel open and prevent restenosis. Sirolimus, an immunosuppressant, inhibits the proliferation of endothelial cells, thereby reducing the risk of restenosis after stent implantation. The sirolimus-eluting coronary stent system effectively maintains blood flow and reduces the likelihood of needing further interventions.

The global Rapamycin Eluting Coronary Stent System market size was estimated at USD 1450.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
