Abstracts

The raw material of the longevity drug MMN, the full name of which is γ -Nicotinamide Mononucleotide, is a molecule that exists naturally in all life forms and is also one of the basic structural units of nucleic acid RNA. It is composed of nicotinamide, ribose and phosphate groups, and is the direct precursor of nicotinamide adenine dinucleotide (NAD⁺). NAD⁺ is a coenzyme that is essential for the energy metabolism of human cells and participates in a variety of intracellular reactions, including cellular energy production, DNA repair, and as a substrate for enzymes. As we age, the content of NAD⁺ in the human body gradually decreases, which is considered to be a basic feature of aging. Therefore, supplementing NMN has become a strategy to increase NAD⁺ levels and thus exert anti-aging effects. By supplementing NMN, the NAD⁺ content in the body can be increased, thereby regulating a variety of downstream biochemical processes, including cellular energy metabolism, DNA repair and cellular stress response, thereby participating in the aging mechanism of cells and delaying the aging process.
