Abstracts

A Reactor Coolant Pump (RCP) is a critical component in nuclear power plants, responsible for circulating the coolant (typically water) through the nuclear reactor to absorb and transport the heat generated by the nuclear fission process. This circulation is essential to prevent the reactor from overheating and ensures that the heat can be transferred efficiently to steam generators or other heat exchangers for power production. Nuclear power is one of the cleanest, safest, most efficient and smallest forms of energy. It has incomparable advantages and an indispensable role in addressing global climate change, promoting green energy transformation and ensuring energy security. Since the world's first nuclear power plant was put into operation in the 1950s, the peaceful use of nuclear energy has been playing an important role in promoting global economic and social development. In the environment of vigorously promoting the development of clean energy, nuclear power will play a wider role. By the end of 2023, there were 413 nuclear power units in operation in 32 countries and regions in the world, with a total installed capacity of 371.51 million kilowatts. Compared with 2022, the number of countries with operating nuclear power units in the world in 2023 will decrease by one, which is Germany, which has shut down all domestic nuclear power units. It is estimated that global nuclear power generation will reach 2.6 trillion kilowatt-hours in 2023, accounting for about 9.5% of the global power structure. In 2023, the International Atomic Energy Agency made a separate statistics of nuclear power units that were temporarily shut down. There were 25 nuclear power units temporarily shut down in the world, with a total installed capacity of 21.228 million kilowatts, all distributed in Japan and India. Among them, 21 nuclear power units in Japan were suspended, with a total installed capacity of 20.588 million kilowatts, and 4 nuclear power units in India, with a total installed capacity of 640,000 kilowatts. By the end of 2023, 57 nuclear power units were under construction in 18 countries around the world, with a total installed capacity of approximately 59.867 million kilowatts. New

nuclear power units are the main driving force for the growth of the reactor coolant pump market.

The global Reactor Coolant Pump market size was estimated at USD 1624.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
