Report Overview

Rear-side aluminum paste is a specialized conductive material primarily used in the photovoltaic (PV) industry for the back electrode of solar cells, particularly in PERC (Passivated Emitter and Rear Cell) and other high-efficiency cell designs. It consists of finely ground aluminum particles dispersed in an organic solvent or resin system, which, when screen-printed and fired, forms a highly conductive layer that enhances electrical contact and improves light reflection, thereby boosting solar cell efficiency. The product is critical for ensuring low resistance, good adhesion, and long-term durability in solar panels. Its performance is influenced by factors such as particle size distribution, paste viscosity, and sintering behavior, making it a key focus area for R&D in the PV supply chain. The market demand is closely tied to solar energy adoption, with growth driven by increasing installations of high-efficiency modules and advancements in cell technologies requiring optimized rear-side metallization.
